Overview

- We propose to use natural and socioeconomic coastal variables specific to Puerto Rico to generate spatially explicit estimators of risk.
- Then combine this information within geographic information systems to produce an overall risk ratio scale.
- Using these data within GIS, we map the coastal areas for their cumulative risk, specifically related to the degradation of coral reef ecosystems.

Threats

Coastal Pressures

Effects

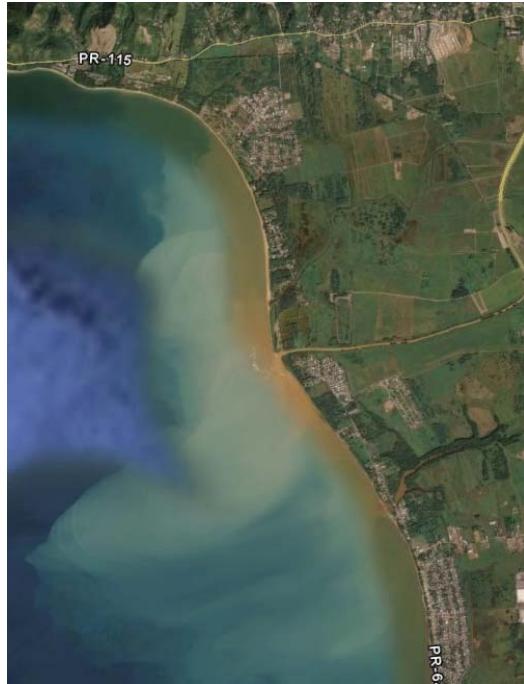

Turbidity
Pollution
Eutrophication
Fishing pressure

River Plume
Sewage
Land uses
Ports
Fish Landings
Development

Temperature
Algal blooms
Oxygen depletion
Stock (Yields)
Nursery areas

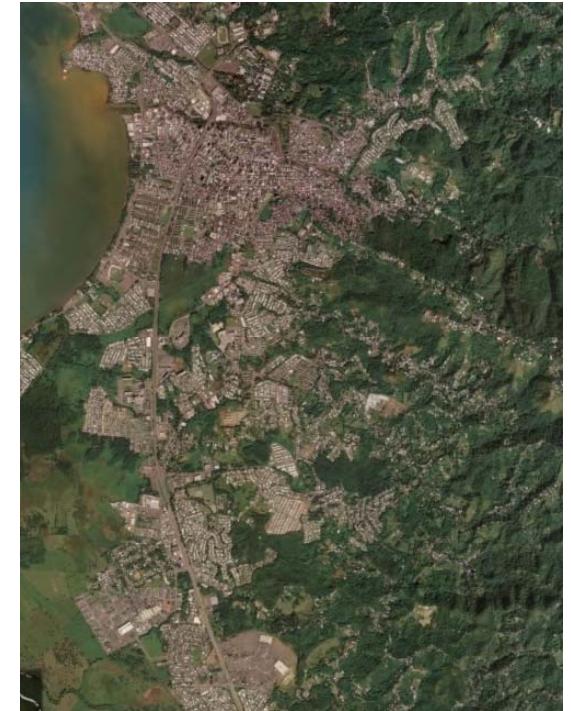

Social and Biophysical Stress

Plume
(sediment and pollution)

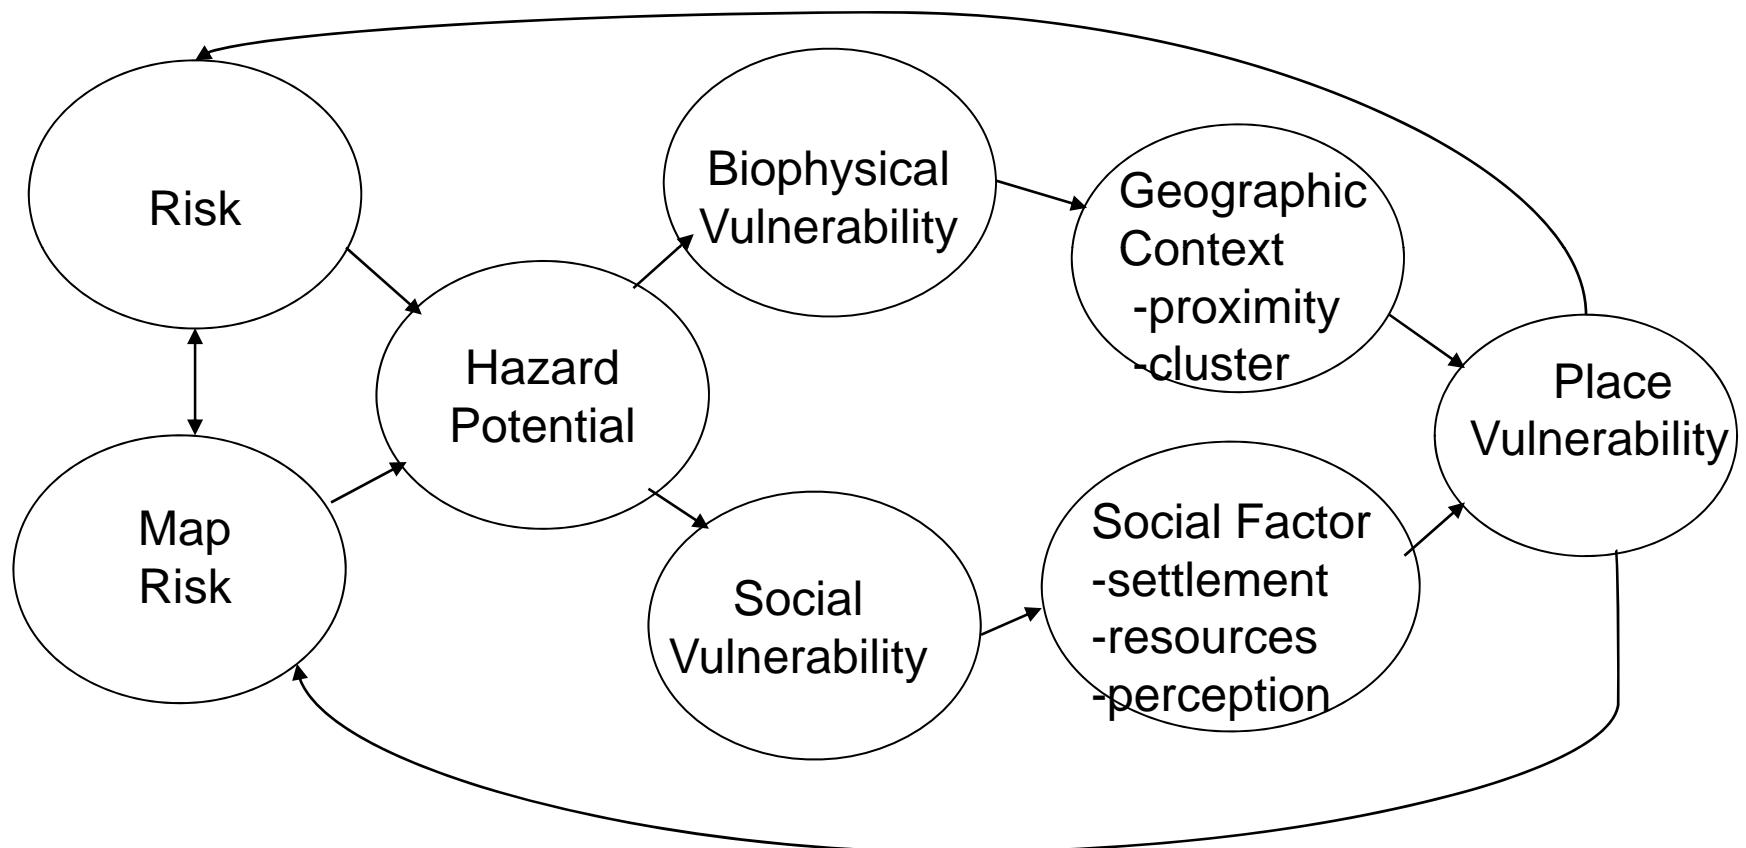

Sewage

Land use

Model approach

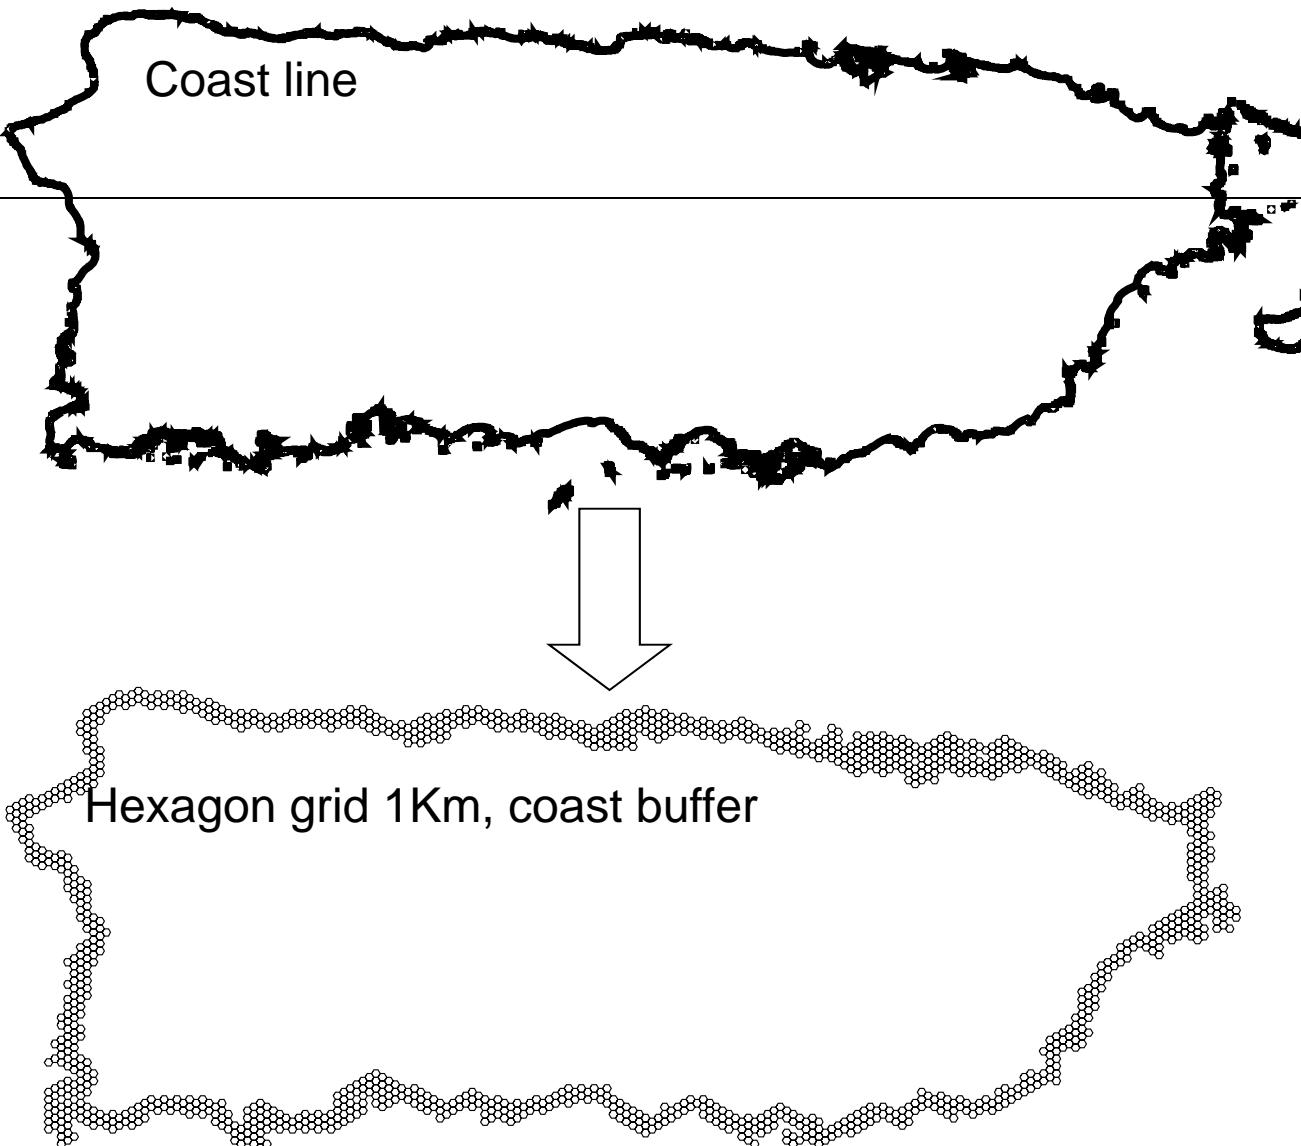

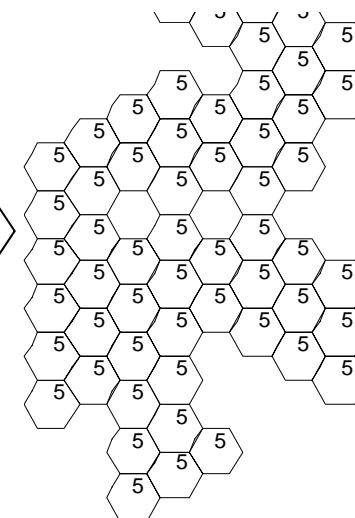

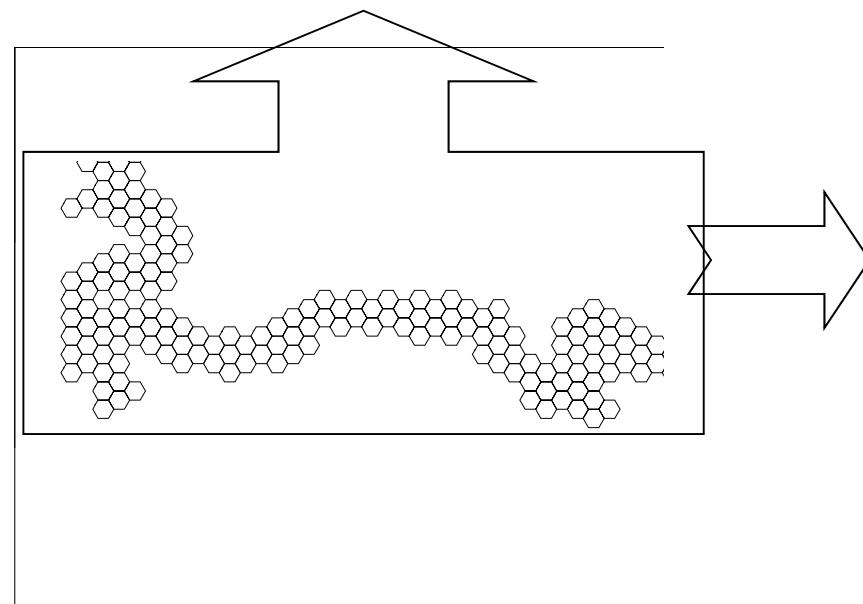

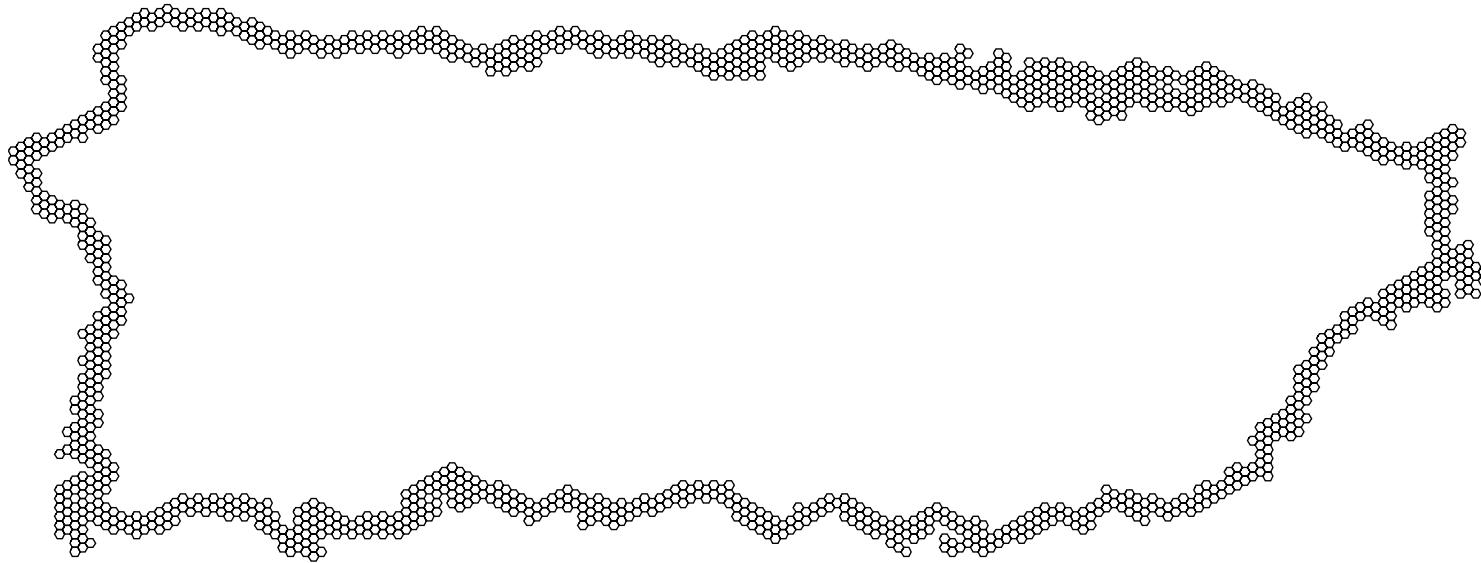

Vulnerability Ranking

Variable	None (0)	Low(1)	(2)	Moderate (3)	(4)	High (5)
Land use	Forest			Shrub	pasture	Urban
River discharge	0	<43304	1674	323907	774935	4714614
Relative Erosion	0	15	16-60	51-125	126-200	201-220
Fisheries pressure	0	1-13	14-21	22-32	33-48	49-125

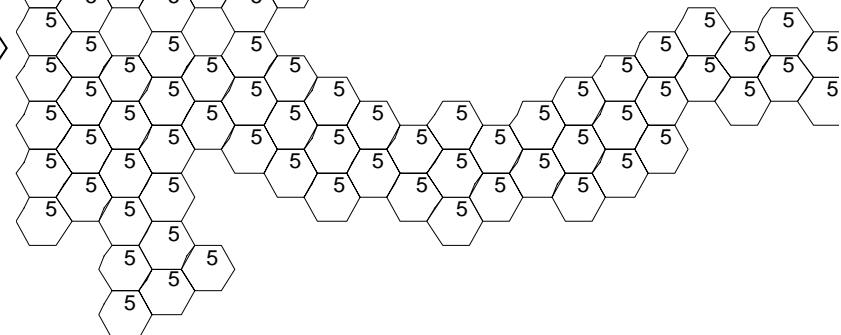

$$VR = \frac{X_A + X_B + X_c + \dots X_n}{N}$$

Layers

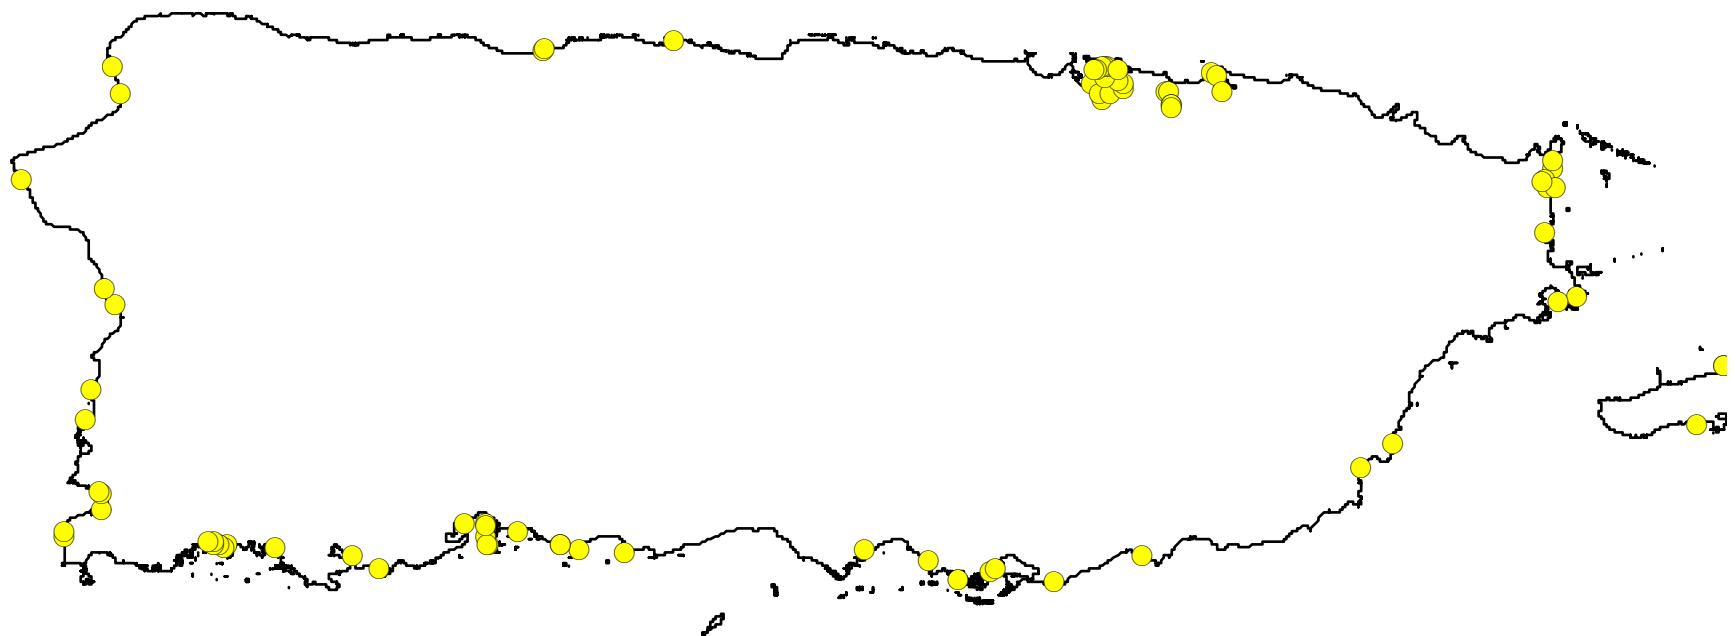

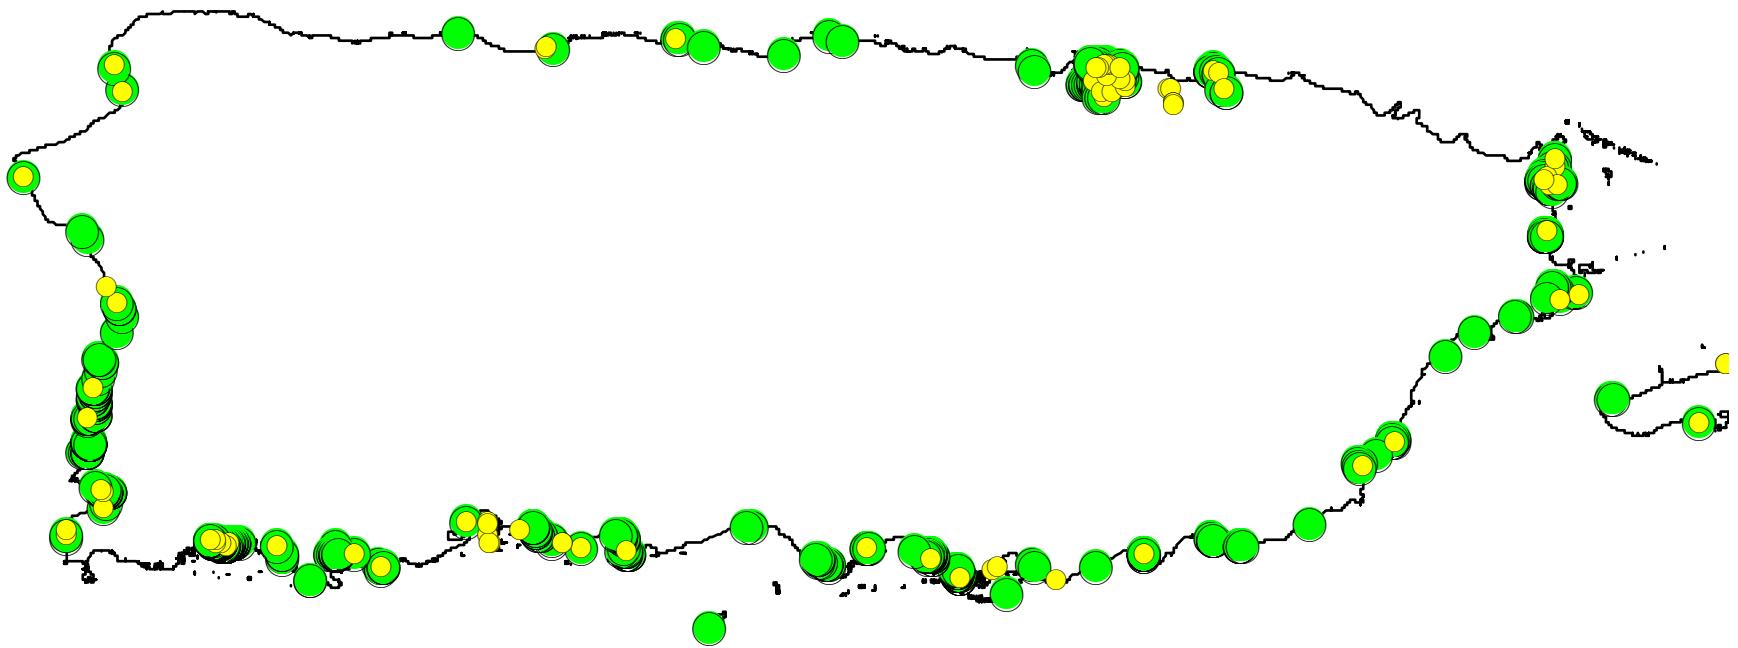

Values assigned

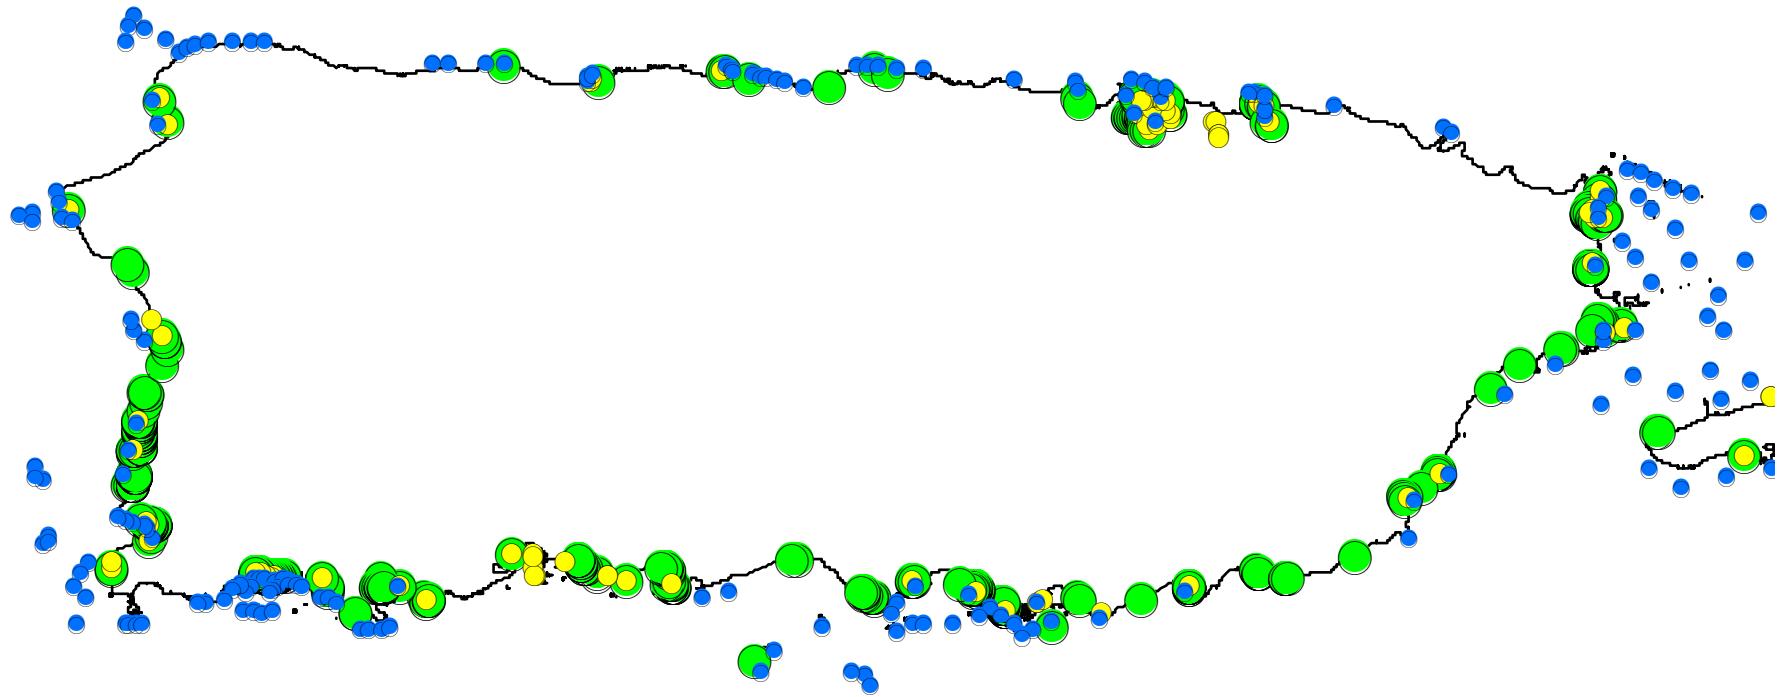

Commercials and Recreational Pressure: Ramps+ Marinas + Port

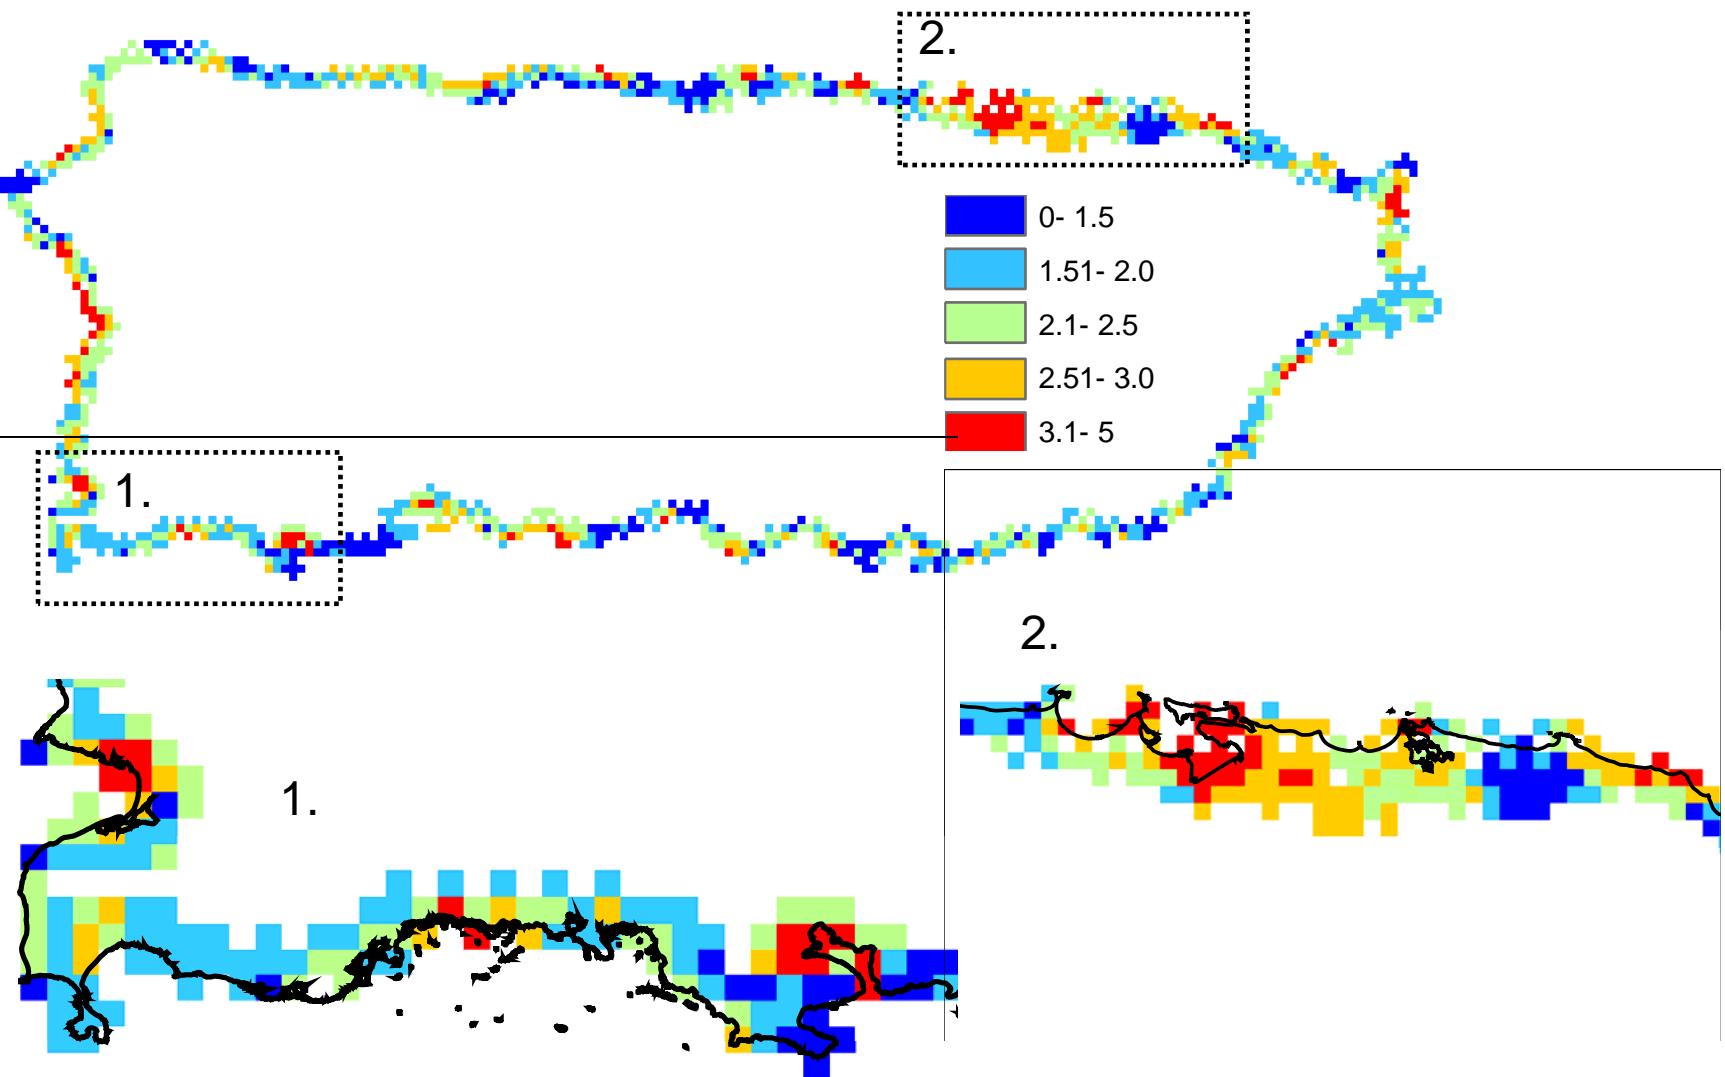

Commercials and Recreational Pressure: Ramps + Marinas+ Port + Dock

Commercials and Recreational Pressure: Ramps+ Marinas + Port + Dock + Fishing ground

Preliminary Results

Remarks

- Maps can then assist in the implementation of management strategies.
- Results can then combine with others mathematical model in the design of marine protected areas.
